

CargoSoft TMS – the global software solution for transport and logistics

The CargoSoft transport management system (TMS) is a mature, user-friendly software package: the optimal tool for the complex challenges that confront logisticians. The application has been installed in four hundred locations across the globe, and more than 9000 users work with it on a daily basis. CargoSoft TMS can be installed locally at your business or leased as SaaS (Software as a Service) in our computer center.

The central modules of CargoSoft TMS:

Sea freight

With integrated interfaces to all participants, CargoSoft TMS makes it possible to process all activities in intermodal transport without changing the application. Every function – planning, order entry, documentation, customs clearance, billing, quality management – are incorporated. Manifests and bills of lading are generated quickly. Clear parameters, due to standardized, effective clearance processes, make the software easy to operate and enable lean order entry by using templates, text modules, as well as giving the option of copying already existing orders.

Air freight

CargoSoft TMS also offers all functions for import and export in the air freight sector. Orders can be entered easily with templates, text modules, simple copying and customer and agent connections by EDI transfer. Users also save time through the importation of eRates and IATA rates. Pre- and post-carriage, shipping accounts, invoices, consolidation, and also real time credit limit checks are additional components of the solution.

Land transport

With this module continental transport services are processed. The additional transportation route to sea and air freight includes all decisive procedures of the pre-carriage, carriage and post-carriage and can be monitored optimally – when considered separately – for the purpose of costs analysis. Freight transport and collective shipments can be cleared easily, thanks to the structured model. Of course, the shipping account, invoice (profit /posting), consolidation and also the real time credit limit check with connection to the outstanding items of the financial bookkeeping are also integrated.

CargoSoft TMS modules on the back »

Warehouse

The CargoSoft TMS module “Lager” (Warehouse) is an efficient warehouse management system that manages and supervises all warehouse logistic processes – from stocking through complete warehouse management to shipping. With this tool, all warehouse orders can be processed professionally and quickly – and the user keeps track constantly.

Customs clearance (e.g. Atlas)

The module is fully integrated into import and export clearance and includes, in addition, all functionalities for the clearance of individual customs applications and the NCTS procedure. By connecting the electronic customs tariff, the user has access to complex research possibilities for determining the correct customs tariff numbers and the customs values. This module has been officially certified by the German customs authorities for all essential ATLAS customs procedures. As an additional feature, for the new Export Control System (ECS) for the ports of Rotterdam and Amsterdam, the interface Port Community System “Portbase” has been developed.

CargoCom/EDI

The implementation of CargoCom/EDI permits the continuous digital mapping of the logistics chain from consignor to consignee – with diverse scope for exchanging information with partners on the basis of EDIFACT or CargoIMP. Call-off orders, delivery notes, invoices and credit notes reach their respective recipient conveniently and simply by electronic means – and ensure reliable and rapid data communication.

Individual Interfaces

Interfaces for proprietary transport carrier systems – such as integrated connection to TCU (Transcontainer-Universal) especially for processing railway orders and lots more.

Integration Accounting

This module enables the automatic transfer of debtor/creditors, automatic comparison of master data between FiBu and CargoSoft TMS and also the automatic transfer of the outstanding items to CargoSoft TMS for the credit limit check. More than forty FiBu systems are already connected.

eAkte (e-file)

In these electronic files all of the procedures in an order, including the documents, are gathered together and arranged clearly: incoming documents such as faxes, invoices, customs paperwork, B/Ls and emails, contact information, deadlines and addresses relating the relevant order. Internal and external documents are managed and made available irrespective of their format (pdf, doc, xls, tif ...).

Business Intelligence

Business intelligence supports management in its decisions with current information about the business. All important operating data on business development can be viewed at all times and conveniently evaluated. The requested statistical data are sought by drill down and presented in different depths of detail, analyzed and used for graphical results displays or importation into Microsoft Excel.

Compliance

An intelligent secure IT solution like CargoSoft Compliance is an indispensable component of your business's internal risk management. The module submits the data from your customers and business operations to an integrated on-line check – updated daily. In this manner you can meet the requirements of a closed compliance chain.

Outstanding items management

With the CargoSoft module “Outstanding Items” you can quickly review and manage all receivables. All decisive processes related to billing that significantly affect bookkeeping are made available. Additional components are payment entry including group payment, keeping a list of outstanding items, and even account extracts and dunning.

CargoIMP (Import Message Platform)

The communication platform designed for the Port of Hamburg by Dakosy AG is integrated directly into CargoSoft TMS. Standardised status reports support all parties involved in the process, to transport the freight quickly out of the port and to speed up its delivery appreciably.

More software solutions from CargoSoft:

CargoSoft GLA

CargoSoft Global Logistic Access (GLA) visualizes the phases of the logistics chain for all participating partners – transparently and in real time within a unified system.

CargoSoft Enterprise Condition Management

This module facilitates transparent rates management for a rapid and reliable quote and contract structure. Using calculable data rates and corridors are compared conveniently and clearly with each other.

CargoSoft CRM

CargoSoft CRM enables you to view systematically and manage, in a manner that spans departments and even branch offices, all customer data from the sales, rates/offers, outstanding items/dunning and project management.
